## **The Revelation of Nature Land Art Generator Plan**

Santa Monica California is a resort town in western Los Angeles City. There is a long-term existing problem, water shortage so that the government has a plan called Land Art Generator Plan to generate clean energy and fresh water for communities.

The proposal site is on the sea out of Santa Monica Pier. The design is based on the exploration and research of urban problems with the usage of biomimicry. It is a new kind of design method which mimics the natural state and natural biological function to obtain effective design strategies and a highly sustainable way to capture large amounts of sea water vapor and generate clean energy for urban public facilities. At the same time, it could become a part of nature, and provide artistic public spaces for communities, which will promote the coexistence of human and nature.

*Vapour Capturing Process*

The biomimicry mesh roof captures a large amount of sea vapour in various conditions of weather and leads vapour to the water pipe entrance which is the lowest place of the roof unit. Then the central water pipe of a flexible column transports fresh water to structural layer. In the meanwhile, piston generators between column units generate

## 01. Double-Faced Existence

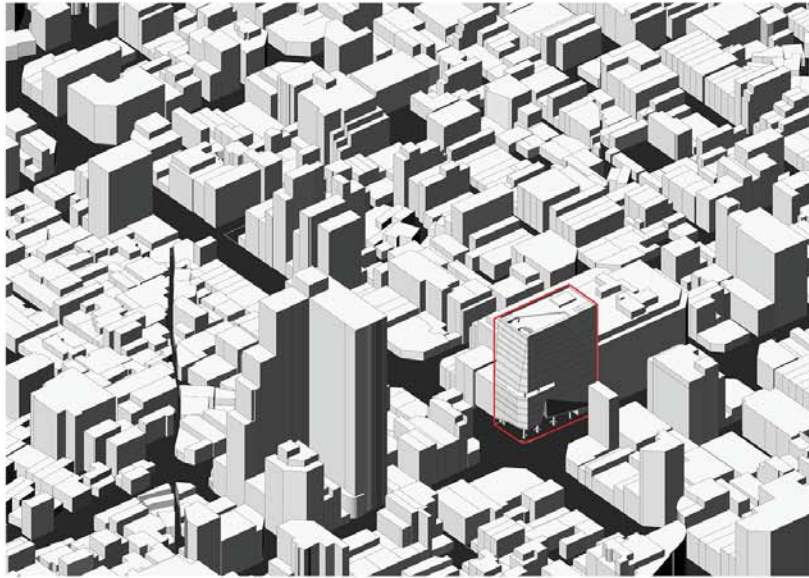

### An In-Between Funky Town for Spiritual Balance

Most of Asian metropolitans' new city centers have gradually lost their own identity and have relied on expansive heroic landmark architecture and grand urban development schemes, it is the right moment to look at the important issue of whether it is adequate to transfer the western ideology of heroic grand scheme for urban development into the Asian township context. It is clear that small and minor intervention strategies for most Asian townships would be the proper way for needs of future and sustainable development due to the considerations of strengthening vernacular identity (such as food culture, ritual activities, festival events, etc.) as well as constraints of financial support from central and/or local authority. On the other hand, how one can tease out a proper analytical model to scrutinize the existing physical environment to work out the most effective microscopic intervention scheme for Asian township development has become the most critical issue in Asia's urban design practice. Thus, this design studio proposes to examine the feasibility of the "Urban Parametric Diagnosis and Acupunctural Microscope Intervention (UPDAMI)" conceptual framework for the Asian township development issue mentioned above.

Taichung downtown was the most booming commercial region in Taichung even in whole Taiwan, but it failed to keep pace with rapid development in recent two decades due to old building, public and private facilities, transportation, trade mode and so on. However, with a long history there are many historical interests and memory including historical block form, delicious traditional food, street atmosphere and so on so that it is not too terrible to renew it totally. The problem is how to protect these treasures and look for a new way to be more alive.

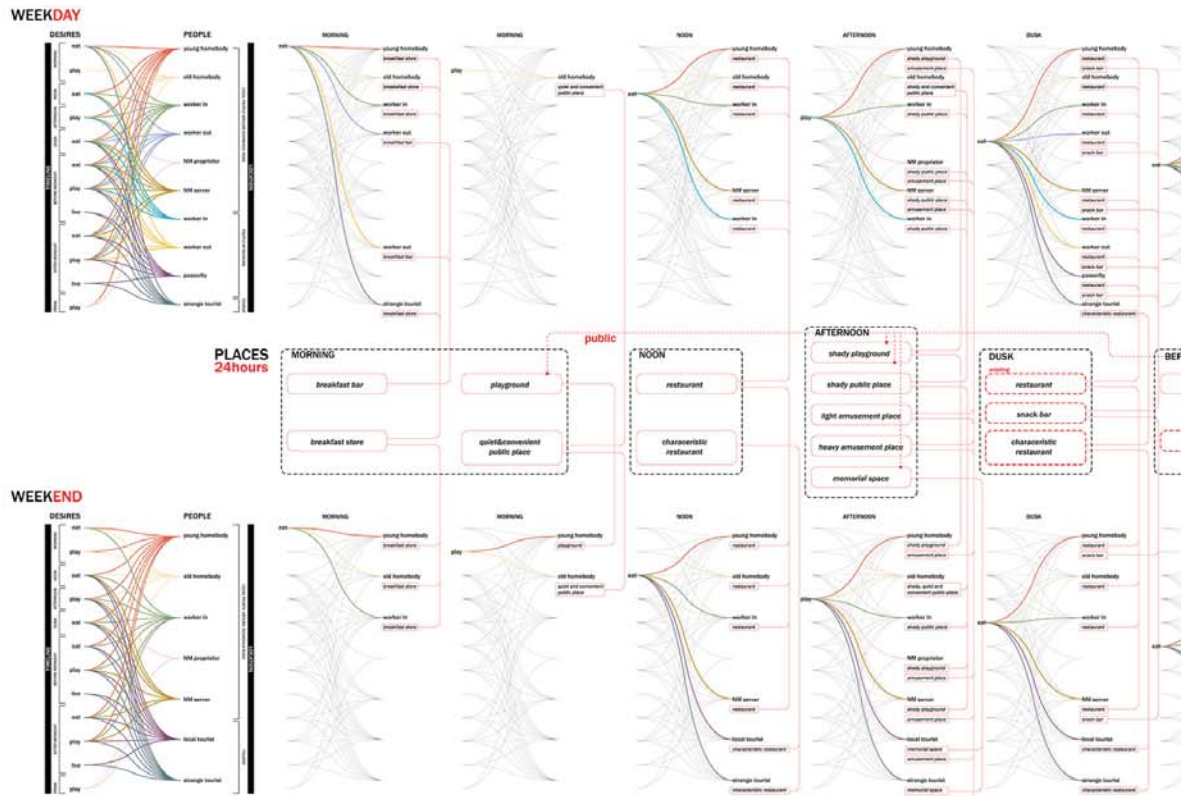

Zhonghua Road was one of the most booming area in downtown even in whole Taichung and known for the night market and amusement places. Unfortunately, it becomes no longer crowded with the decay of whole downtown. However, amusement places and delicious food become the regional features and are still alive with the consumers' protection because of their desire. Therefore, there is a way that taking advantage of consumers' desires to continue protecting these regional features even developed into a new funky town on the night market.

01 DOUBLE-FACED EXISTENCE

*Funky Town in Urban Texture*

It is a typical urban fabric in Taiwan with intensive road net and privatization of land which leads to fragmentation of the region, small scale public spaces, extremely various architectural styles with a lot of building extensions.

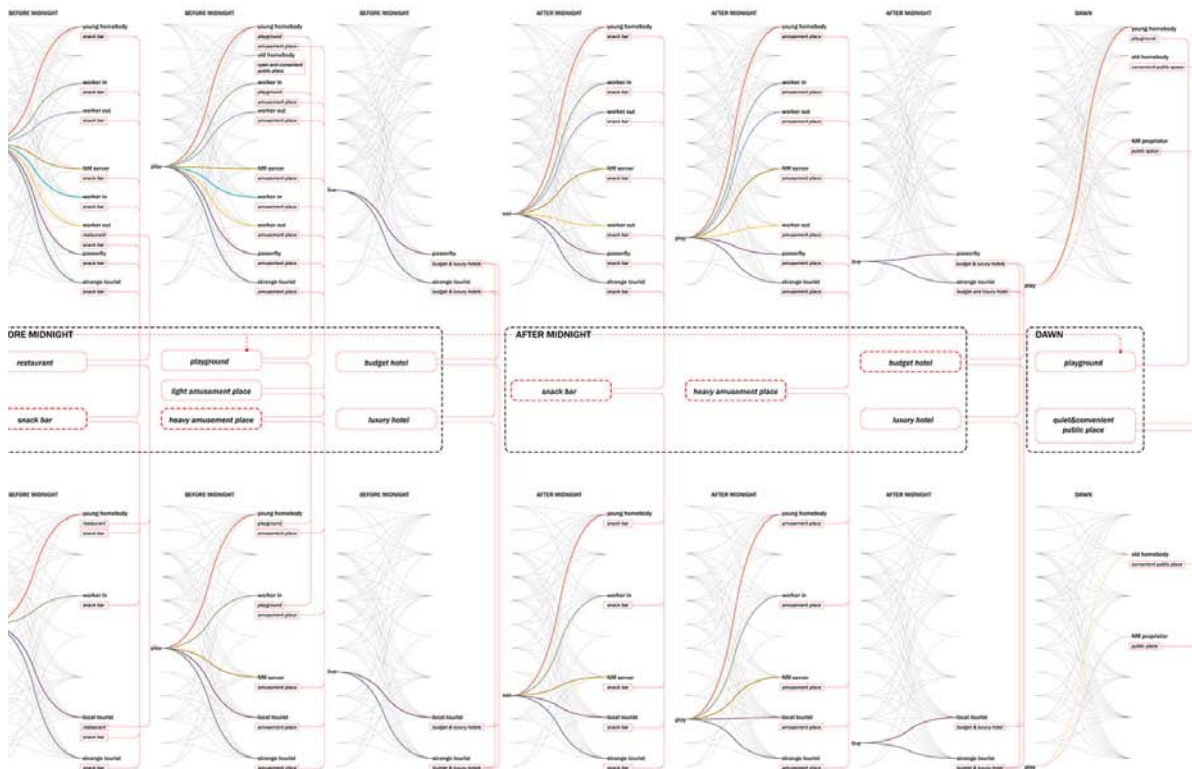

# 01 DOUBLE-FACED EXISTENCE

*Different Scenes in Zhonghua Road*

In the daytime, it is an ordinary road as many others in central district with few passersby and activities. But it turns to be a lively night market along with the fall of the night. However it is not as prosperous as 20 years ago.

*Activities Analysis of Zhonghua Road*

Comparing to the current conditions and activities, various kinds of people perform in different ways and have different kinds of requirements of places in different times, potential requirements of places and people performances come out.

5 Elements From Ganji Game

With the intervention of 5 elements, the inherent way to do the site research for renovation of old core region can be destroyed and we can build a new relationship between thinking elements and urban elements to dig out the deeper urban content for creating new possibilities of development.

1. Gatekeeper

somebody guarding

Local

create the place

guard things they have obstinately and reject change

2. Jinn

something charming

Zhonghua Road Night Market

day and night, different time, different phenomenon

attract people to enjoy themselves

*3. Moat*  
protection  
*Diner*

local around road / Taichunger / tourist  
protect Zhonghua Road Night Market from missing

*4. Simurgh*

something eternal

*ID (primitive desires)*

eating / living / playing

original personality existing forever

### *5. Caravanseri*

a resting place for travellers to recover from the tired journey

### *Soul Station*

It is a place where people can express and control their desires to keep themselves in Ego. It is also a container where events with desire and morality occur in the meantime. People behind the dark interface can express his Id and in the bright space can learn to reach Super-ego. In the double-space building people can face their real identification as a double-faced existence and control the spirit balance .

### *Design Concept*

A suitable mass is cut into two parts by a dark interface changing the transparency according to the light. Each part contains various programs with different properties and the communication between two parts occurs through the interface to help to keep the balance of spirit.

## 01 DOUBLE-FACED EXISTENCE

Translucent red glass

When both sides are bright, the glass is in a transparent state.

When outside is brighter than inside, the glass is in a translucent state.

When outside is much brighter than inside, the glass is in a non-transparent state.

When inside is much brighter than outside, the glass returns to a transparent state.

### *Main Entrance Perspective*

Entrance design expresses the public property of the building and opens the closed community to create the urban plaza for the region with scarce public resources. The abridged mass responds to the small scale urban form and the high transparent facade reveals public activities to show the architectural public property.

*Programs*

*Connection with The Community*

*Various High Squares*

*Vertical Transportation*

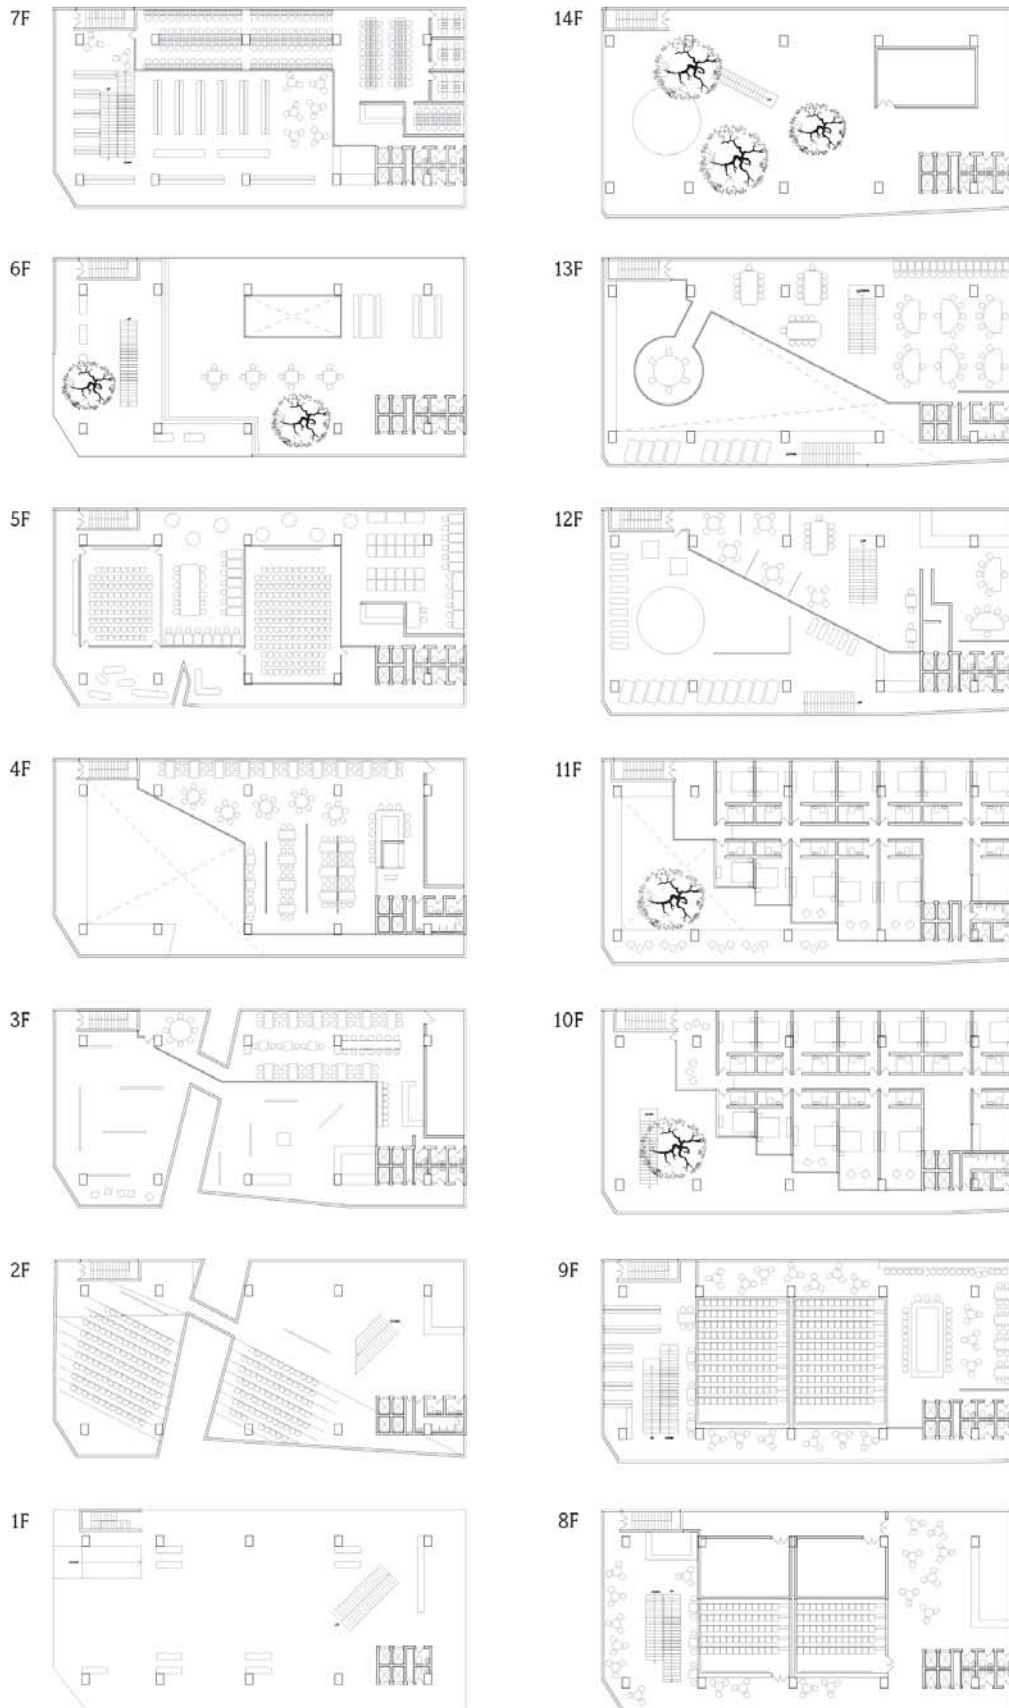

*Interface Between Two Parts*

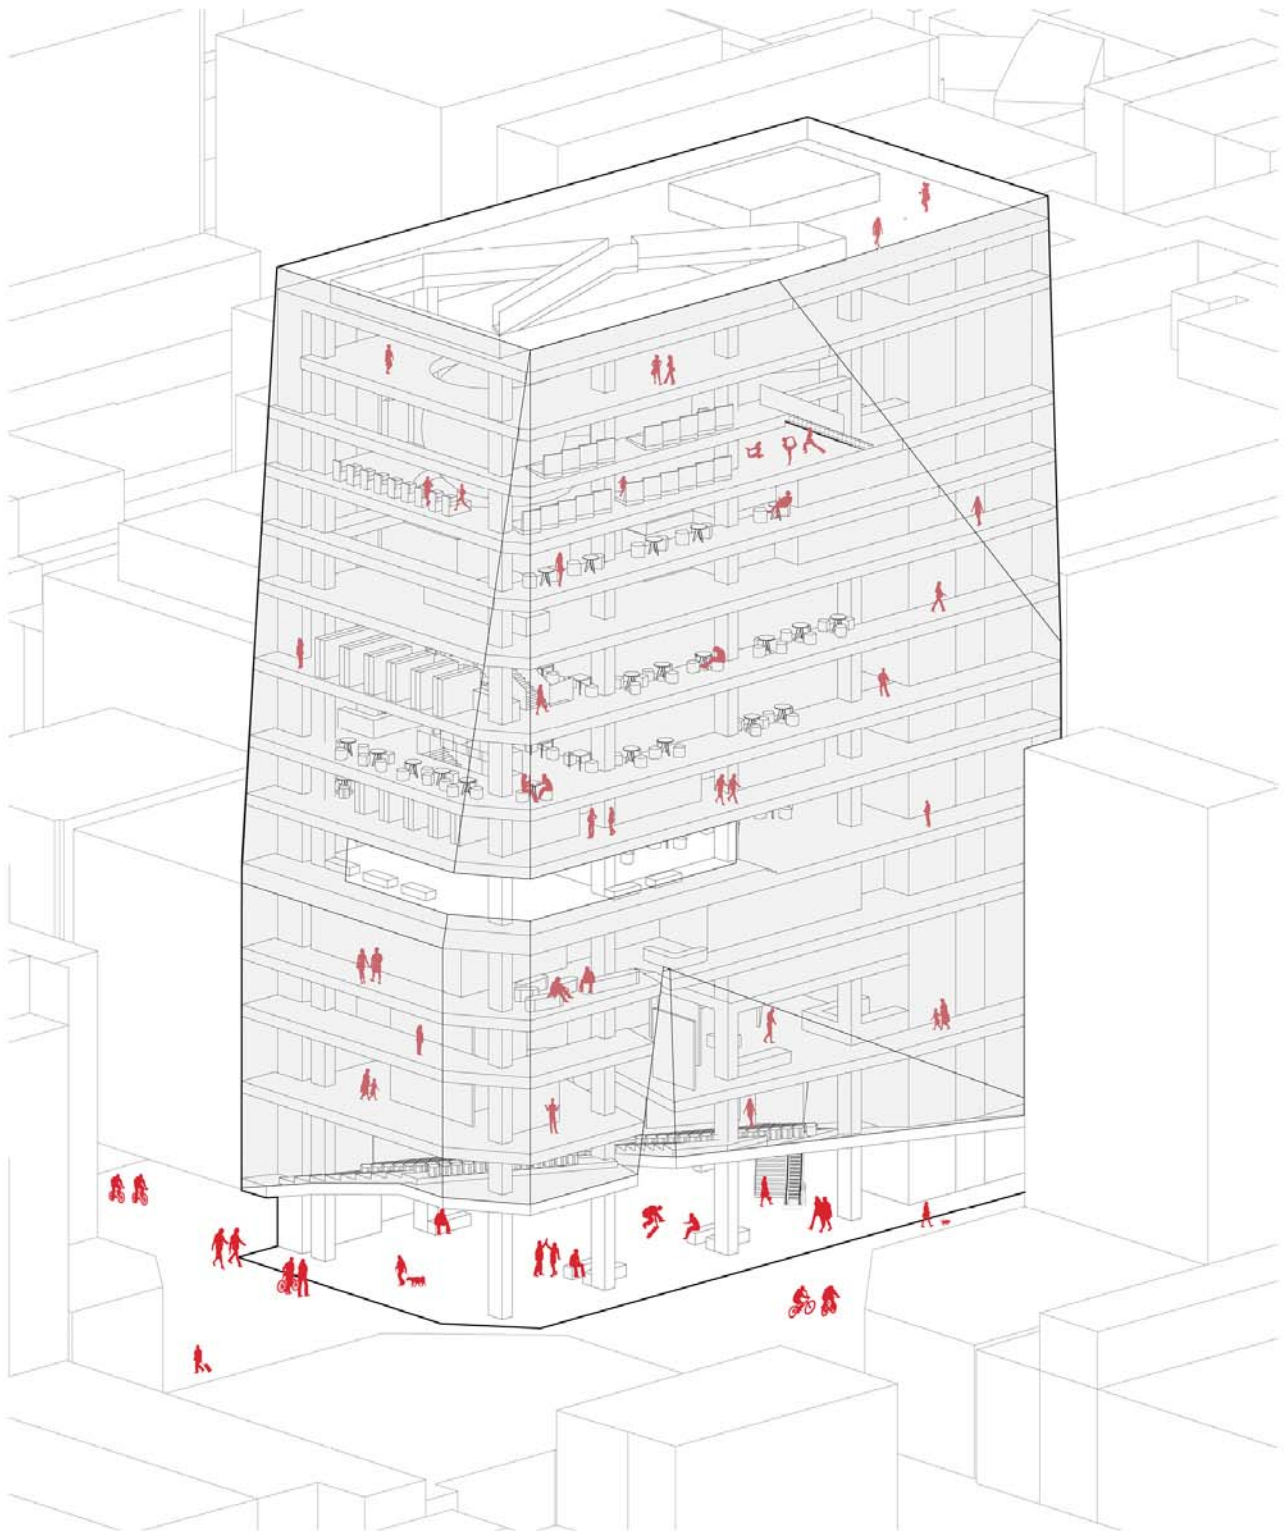

The building consists of different programs which grows vertically according to the properties and developing requirements of Zhonghua Road. Between visible and invisible programs there are different space relationship due to tangible and intangible performances

01 DOUBLE-FACED EXISTENCE

*Floor Plans 1F-14F*

*Axonometric Drawing of The Birdview*

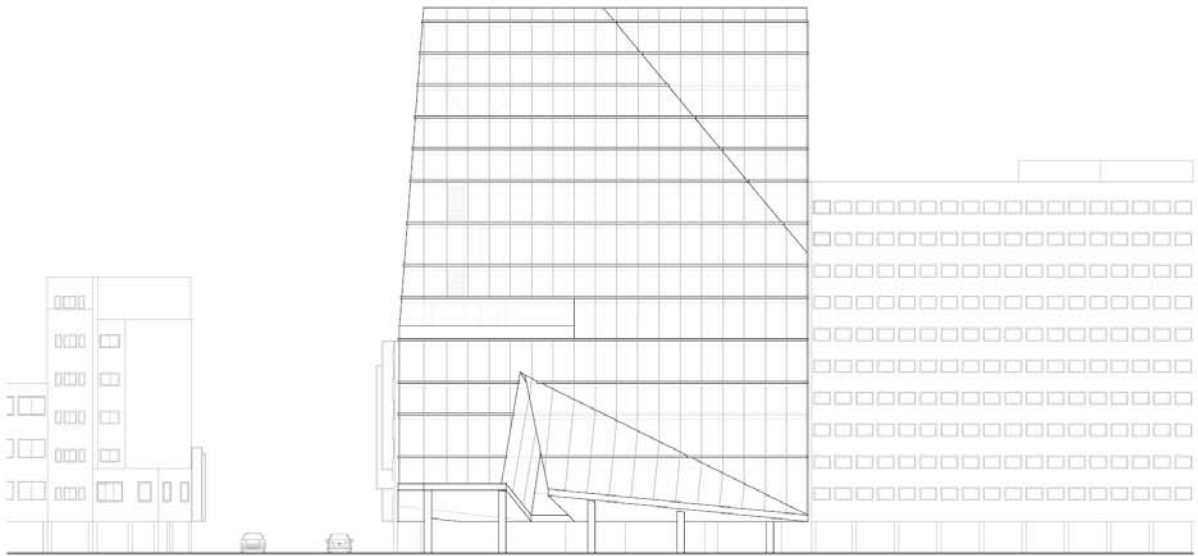

Transparent facade expressing transparent activities and morality

*Axonometric Drawing of The Sector*

Activities behind the dark interface expressing translucent activities and desires

## 02. The Symbiotic Future The Workshop of Biomodd Taichung

Biomodd is a multifaceted socially engaged art installation that finds meaningful relationships between biology, computers and people. On the most basic level, Biomodd creates symbiotic relationships between plants and computers, and ignites conversations among the community around them.

The Biomodd Program was invited and exhibited in Taiwan National Art Museum. The program started in 2007. The artists define their work as an interdisciplinary installation. In the composition of the device, the artists try to place the visual art, ecology, community construction and the elements of computer games in a large object during the process of art work, in the meanwhile, they attempt to find the connections between these different elements and a conceiving of symbiosis and coexist.

Biomodd Program focused on the participation of audience in its process. After the artists arrived at the local companies, gallery and universities, they formed an interdisciplinary team with the audience who would like to participate in and had different background of subjects. The group members may be the artists, art researchers, software engineers, hardware engineers, biologists, botanists and so on. After the artists communicated with the members about their concepts, the team became to use the abandoned electronic components from the local places, reassembled and wrote program language. They created a small self-sufficient ecosystem for plants and small creatures: the abandoned components can be activated and provide the lighting for the plants, while the machine which was continuously working needs cooling through the water form the fish tank and algae. In the process of creating a ecological and electronic installation, the artists and the team members with various cultural background show different logic thinking and art presentation.

*Team Members*

Our team consists of volunteers in different areas and most of us are students majoring in architecture, fine art, industrial design, computer science, biology and so on.

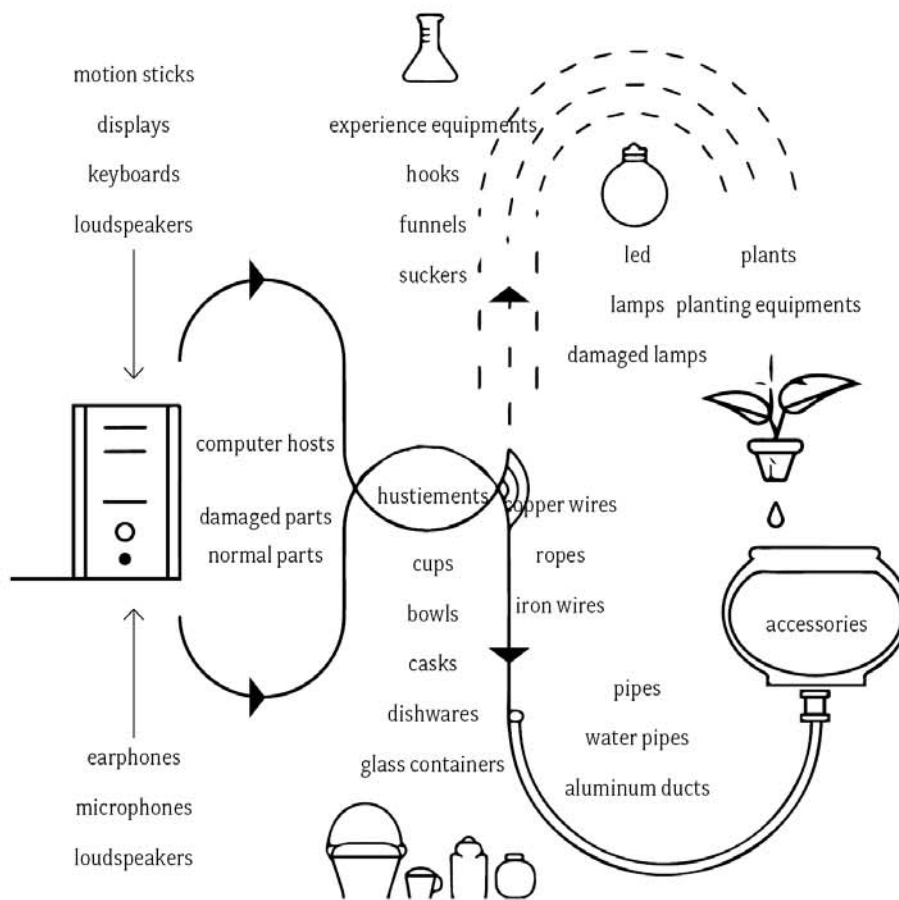

*Initiator : Angelo Vermeulen*

He (born 1971) is a Belgian visual artist. His multidisciplinary oeuvre crosses over the boundaries of biology, technology and community. Vermeulen won the Witteveen+Bos Art+Technology Award in 2012.

### **03. Art As The Beacon of Life**

#### **Lighthouse Sea Hotel Competition**

Lighthouse hotel is located in the seacoast of Murro di Porco, Italy, which is a fantastic place with a long history and invaluable landscape significance. It has a great potential to be an art hotel for artists and tourists.

By considering site conditions, we propose that the hotel should be integrated into the wild landscape to the greatest extent, therefore, we are inspired by the rocks on site as our concept.

The ripraps, which will be art studios, are scattered randomly around the lighthouse and connected with each other via an art gallery. In the meanwhile, the art gallery separates the art studio into two parts, one is living and work space and the other is meditation room. When walking on the art corridor, you can see the lighthouse at each interval between two ripraps, which gives a unique experience with the wild landscape. In the other side, each room has a good view facing the sea, which may give great inspirations to the artists.
